No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents mouse MOP7, a novel member of the PAS superfamily, where PAS stands for PER/ARNY/SIM domains. MOP7 CDNA (see AAX58986) was identified in a search of murine ESTs designed to identify bHIH-PAS proteins, and by RACE amplification of lung CDNA. MOP7 was characterised as hypoxia inducible factor 3 alpha CHIF 1 alpha (see hax106289), HIF 2 alpha (see AAX10629), MOP3 (see CAX106289), HIF 2 alpha (see AAX10629), MOP3 (see CAX106291), Ah receptor and Ah receptor nuclear translocator (ARNT), suggesting a different functional role. MOP7 probably regulates the same genes as HIF 1 alpha and 2 alpha, as evidenced by its confidence of the same core response element. MOP7 may have a functional cof the same core response to low oxygen in the tissues in nucleic acids (see AAX58981-88) and proteins (see AAX106289-97). The invention provides novel MOPS 2-9 nucleic acids (see AAX58981-88) and proteins (see AAX106289-97). The same underly of research, diagnostic and therapeutic applications. Several of the MOPS are alpha-class of the provides in circadian signal contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 182;

cc sequence and an oligonucleotide comprising a sequence complementary to a cc polynucleotide which comprises a 3'-end sequence, where the cc oligonucleotide which comprises a 3'-end sequence, where the cc oligonucleotide comprises at least 15 nucleotides, where the combination of the 5'-end sequence/3'-end sequence is selected from those defined in cc the specification. The primer sets can be used in antisense therapy and cc in gene therapy. The primers are useful for synthesising polynucleotides, cc particularly full-length cDNAs. The primers are also useful for the cc detection and/or diagnosis of the abnormality of the proteins encoded by ct full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and cc AAH3363 to AAH18742 represent human cDNA sequences; AAB92446 to captscent oligonucleotides, all of which are used in the exemplification co of the present invention.

The present invention describes primer sets for synthesising 5602 Cf full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination complementary strand of a polynucleotide which comprises a 5'-end complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence, where the coligonucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence, where the coligonucleotide which comprises a 1-east 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, comparticularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH03166 to AAH13638 and CAAH3633 to AAH8742 represent human cDNA sequences; and AAH3629 to AAH3632 constant of the special seaf of the special sea

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT
                                                   CC full-length cloward defined in the specification. Where a primer set to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination companies and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide which comprises a 5'-end sequence complementary to a combination of the 5'-end sequence?3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and compensed in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the collars easily without any specialised methods. AAH013166 to AAH13632 and AAH13633 represent human anino acid sequences; AAB92446 to AAH3632 represent human cDNA sequences; AAB92446 to AAH3632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-JAN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                        represented by the present sequence. The variants are useful for identifying compounds capable of modulating the function of a functional domain of human HIF-lalpha. The method comprises contacting a candidate compound with a cell expressing a HIF-lalpha variant conjugated to a molecular probe. The localization of the probe can be detected in the cell. The Aequeora victoria green fluorescent protein can be used as the molecular probe. The compounds are useful for the regulation of HIF-lalpha target genes, such as those involved in the regulation of
                                                                                                                                                                                                   This sequence represents a fragment of the hypoxia-inducible factor (HIF)-lalpha amino acid sequence. The mechanism of action of HIF-Lalpha is a multi-step process which includes hypoxia-dependent nuclear import and activation of the transactivation domain. The HIF-lalpha consists of a number of functional domains including a PAS-B (Per, Arnt, Sim) domain located in human HIF-lalpha between amino acids 173 and 390, a C-terminal nuclear localization sequence located at amino acids 718-584, a transactivator domain (N-TAD) located between amino acids 531 and 584, transactivator domain (N-TAD) located between amino acids 531 and 584, transactivator domain (N-TAD) located between amino acids 531 and 584,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hypoxia-inducible factor lalpha; HIF-lalpha; PAS-B; N-TAD; regulation; angiogenesis; erythropoiesis; glycolysis; humar

Sequence

This sequence represents a fragment of the hypoxia-inducible factor (HIF)-lalpha amino acid sequence. The mechanism of action of HIF-lalpha is a multi-step process which includes hypoxia-dependent nuclear import and activation of the transactivation domain. The HIF-lalpha consists of a number of functional domains including a PAS-B (Per, Arnt, Sim) domain located in human HIF-lalpha between amino acids 173 and 390, a C-terminal nuclear localization sequence located at amino acids 718-584, a nuclear localization sequence located between amino acids 531 and 584, and a second transactivator domain (C-TAD) located between 813 and 826. The invention relates to isolated variants of HIF-lalpha, such as that represented by the research of the second variants of HIF-lalpha.

The method comprises contacting a candidate compound with a cell expressing a HIF-lalpha variant conjugated to a molecular probe. The localization of the probe can be detected in the cell. The Aequeora victoria green fluorescent protein can be used as the molecular probe. The compounds are useful for the regulation of HIF-lalpha target genes, such as those involved in the regulation of angiogenesis, erythropolesis an glycolysis.
                                                                                                                                                                                                                                                                                                            Human; hypoxia-inducible factor 1 alpha; HIF-lalpha; variant; hypoxia inducible gene; hypoxia inducible factor; hypoxia; ischemia related damage; angiogenesis; coronary artery disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
 Claim
                         Variant forms of hypoxia-inducible factor (HIF)-1 alpha, useful treating hypoxia or ischemia-related tissue damage -
                                                                                                                                                                                                                                WO200010578-A1
                                                                                                                                                                                                                                                                                                                                                                  A variant of human hypoxia inducible factor-1 alpha protein.
                                                                                                                                                                                                                                                                                                                                                                                             03-JUL-2000
                                                                                                                                                                                                                                                                                                                                                                                                                        AAY84168;

The HIF-lalpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 429-826, 469-826, 494-826, 508-826, 512-826 or 517-826 of the wild type human HIF-lalpha polypeptide, in which residues 551 and 552 are not serine and threonine, respectively. The HIF-lalpha variant polynucleotide sequences are useful for increasing expression of a hypoxia inducible gene in a cell. They is also useful for providing constitutive expression of a hypoxia inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-lalpha polypeptides are useful for providing prophylactic therapy for inducing the level of and prophylactic therapy for inducing the level of and prophylactic for the provides and the level of and prophylactic therapy for inducing the level of and prophylactic for the provides and the level of and prophylactic for the provides and the level of and prophylactic for the provides are useful for providing prophylactic therapy for inducing the level of and prophylactic for the provides are useful for providing prophylactic therapy for inducing the level of and prophylactic for the provides are useful for providing prophylactic therapy for inducing the level of and prophylactic for the provides are useful for providing prophylactic therapy for inducing the level of and prophylactic for the provides are useful for providing prophylactic therapy for inducing the level of and prophylactic therapy for inducing the level of the provides are useful for providing prophylactic therapy for inducing the level of the provides are useful for provides are useful for provides and prophylactic therapy for inducing the prophylactic prophylactic therapy for inducing the prophylactic prophylactic prophylactic prophylactic prophylactic prophyla

The invention relates to isolated variants of HIF-lalpha, such as that represented by the present sequence. The variants are useful for identifying compounds capable of modulating the function of a functional domain of human HIF-lalpha. The method comprises contacting a candidate compound with a cell expressing a HIF-lalpha variant conjugated to a molecular probe. The localization of the probe can be detected in the cell. The Aequeorar victoria green fluorescent protein can be used as the milecular probe. The compounds are useful for the regulation of antiquence is certificated as those involved in the regulation of

The mechanism of action of HIF-lalpha is a multi-step process which includes hypoxia-dependent nuclear import and activation of the transactivation domain. The HIF-lalpha consists of a number of functional domains including a PAS-B (Per, Arnt, Sim) domain located in human HIF-lalpha between amino acids 173 and 390, a C-terminal
                              Human; hypoxia-inducible factor 1 alpha; HIF-lalpha; variant; hypoxia inducible gene; hypoxia inducible factor; hypoxia; ischemia related damage; angiogenesis; coronary artery diseasischemic tissue damage.

                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a variant of hypoxia-inducible factor (HFF)-1 alpha, comprising amino acids 1-391 and 549-826 of the wild type protein (see AAX69407). The HIF-lalpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 429-826, 469-826, 494-826, 508-826, 512-826 or 517-826 of the wild type human HIF-lalpha threonine, copyrighted, in which residues 551 and 552 are not serine and threonine, respectively. The HIF-lalpha variant polynucleotide sequences are useful for increasing expression of a hypoxia inducible gene in a cell. They is also useful for providing constitutive expression of a hypoxia inducible factor in a cell, and for reducing or preventing hypoxia inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-lalpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogenesis in tissues of patients at risk of coronary artery disease
                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                   Š
                                                                                                                                                                                                                                                                                              The present sequence represents a variant of hypoxia-inducible factor (HIF)-1 alpha, comprising amino acids 1-91 and 521-826 of the wild type protein (see ANG9407). The HIF-lalpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 549-826 of 517-826 of the wild type human HIF-lalpha polypeptide, in which residues 551 and 552 are not serine and threonine, respectively. The HIF-lalpha variant polynucleotide sequences are useful for increasing expression of a hypoxia inducible gene in a cell. They is also useful for providing constitutive expression of a hypoxia inducible factor in a cell, and for reducing or preventing hypoxia inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-lalpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogeness in tissues of patients at risk of coronary artery disease

                                     The present sequence represents a variant of hypoxia-inducible factor (HIF)-l alpha, comprising amino acids 1-91 and 517-826 of the wild type protein (see ANK69407). The HIF-lalpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 499-826, 578-826 or 517-826 of the wild type human HIF-lalpha ocid polypeptide, in which residues 551 and 552 are not serine and threonine, respectively. The HIF-lalpha variant polypucleotide sequences are useful for increasing expression of a hypoxia inducible gene in a cell. They is also useful for providing constitutive expression of a hypoxia inducible factor in a cell, and for reducing or preventing hypoxia or inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-lalpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogenesis in tissues of patients at risk of coronary artery disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2000-246493/21

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC (HFF)-1 alpha, comprising amino acids 1-391 and 508-826 of the wild CC (type protein (see AAY69407). The HIF-lalpha variants are stable under CC hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 429-826, 469-826, 512-826 or 517-826 of the wild type human HIF-lalpha CC 508-826, 512-826 or 517-826 of the wild type human HIF-lalpha CC polypeptide, in which residues 551 and 552 are not serine and threonine, CC respectively. The HIF-lalpha variant polynucleotide sequences are useful CC for increasing expression of a hypoxia inducible gene in a cell. They cis also useful for providing constitutive expression of a hypoxia or cischemia related damage. The variant HIF-lalpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogenesis in tissues of patients at risk of coronary artery disease or ischemic tissue damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The HIF-1alpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 429-826, 499-826, 494-826, 508-826, 512-826 or 517-826 of the wild type human HIF-1alpha polypeptide, in which residues 551 and 552 are not serine and threonine, respectively. The HIF-1alpha variant polynucleotide sequences are useful for increasing expression of a hypoxia inducible gene in a cell. They is also useful for providing constitutive expression of a hypoxia inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-1alpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogenesis in tissues of patients at risk of coronary artery disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

The HIF-lalpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 429-826, 494-826, 508-826, 512-826 or 517-826 of the wild type human HIF-lalpha polypeptide, in which residues 551 and 552 are not serine and threonine,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-Lalpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogenesis in tissues of patients at risk of coronary artery disease or ischemic tissue damage.

RESULT 1
                                          The present sequence represents a variant of hypoxia-inducible factor (HIF)-1 alpha, comprising amino acids 1-31 and 429-826 of the wild type protein (see AAY69407). The HIF-1alpha variants are stable under hypoxic and non-hypoxic conditions. The variants comprises amino acid residues 1-391 and 521-826, 549-826, 576-826, 429-826, 498-826, 494-826, 508-826, 512-826 or 517-826 of the wild type human HIF-1alpha polypeptide, in which residues 551 and 552 are not serine and threonine, respectively. The HIF-1alpha variant polypucleotide sequences are useful for increasing expression of a hypoxia inducible factor in a cell, and for reducing or preventing hypoxia or ischemia related damage. The variant HIF-1alpha polypeptides are useful for providing prophylactic therapy for inducing the level of angiogenesis in tissues of patients at risk of coronary artery disease
